# CHALLENGES WITH FIXED LENS CAMERAS

With fixed lens cameras, only a relatively small area – close to the focal point and within a narrow depth of field – can be viewed in clear, sharp detail.

Fixed lens video surveillance cameras suffer from various constraints and limitations, including:

## Inability to zoom

Users cannot zoom in to see more detail on close-range targets.

## High labor costs for system design

System designers need to measure the size of the monitored area and complete tedious calculations to choose camera models with proper focal lengths.

## Overstock of cameras

Distributors and installers have to keep huge inventory of fixed lens cameras with different focal lengths on hand to meet various installation requirements.

# ADVANTAGES OF VARIFOCAL CAMERAS

## Budget-friendly on site survey

Varifocal cameras adapt to more complex site conditions than fixed lens cameras. This means installers will require less time to measure a site to find optimal camera positions.

## Motorized zooming

The varifocal lenses are motorized through remote configuration on an NVR or via client software, so users can zoom in to see close targets more clearly.

## Installation flexibility

Cameras with varifocal lenses are much easier to install. Focal lengths are adjustable for a wider range of monitoring areas. With this adaptability comes more flexibility, too, as many more camera installation locations become possible.

## Easier inventory management

Fewer varifocal camera models are required to effectively monitor a given area than fixed lens cameras. Distributors and installers can save money by keeping fewer models of cameras in stock when they use varifocal models.
