HIKVISION®

BACK TO BUSINESS SOLUTIONS FOR HOSPITALS

Holistic protection for everyone

Pain Points

As levels of uncertainty fluctuate, hospitals face new challenges in keeping their visitors, staff, and patients safe and healthy while managing surges in demand and shortages in supplies. Hospital administrators are asking:

- How can we screen skin temperatures regularly and safely in each area of a hospital?
- How can we manage the way people enter and move through the various nodes of the hospital?
- How can we maintain situational awareness and respond quickly in case of an emergency?

Our Solutions

Now with Hikvision's Back-to-Business Solutions for Hospitals, the questions above have answers, and the unique needs of typical healthcare scenarios can be easily met.

Multi-Site Temperature Screening

A variety of products and measures for safe and efficient temperature screening in multiple locations.

Completely Touch-Free Access

Embedded facial recognition provides 100% hands-free access to key areas.

Highly Centralised Management

Instant visualisation of emergency events and overall statistics for situational awareness.

Preliminary Temperature Screening
in the Lobby

Preliminary temperature screening can be completed at preset zones in lobbies to reduce external influence (such as wind, weather, etc.) for more accurate temperature readings. Ideally, an indoor walking distance or waiting time shall be reserved to allow visitors' skin-surface temperatures to normalise. Alarms will be triggered if the pre-defined temperature threshold is exceeded. Persons having elevated skin-surface temperatures should be further confirmed using clinical measurement devices and be guided to assigned areas.
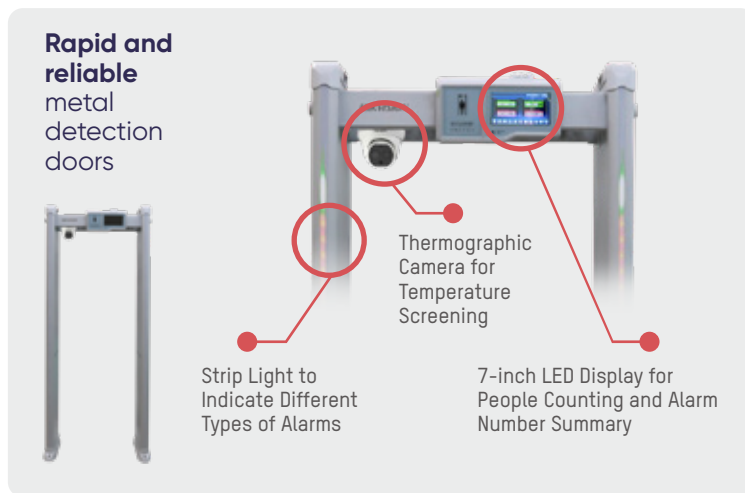

Quick installation with thermographic cameras

Instant visualisation of temperature and mask detection with DeepinMind NVRs

Rapid and reliable metal detection doors

Thermographic Camera for Temperature Screening

Strip Light to Indicate Different Types of Alarms

7-inch LED Display for People Counting and Alarm Number Summary

✖ Touch-Free Access to
Consultation Rooms and Pharmacy

Staff is the most critical resource in virtually every aspect of healthcare. So protecting their health is crucial. Terminals embedded with facial recognition provide hygienic authentication and/or access to consultation rooms and pharmacies with no physical contact.
These terminals also integrate staff attendance, temperature measurement, and face mask detection.

Temperature screening with MinMoe terminals

✕ **Powerful Data Visualisation**
and Centralised Management

In the control room, hospital administrators and security staff can view statistics and records of all connected areas in real time, respond to alarms quickly, search and archive evidence, manage access and attendance, and even generate reports using HikCentral software.

HikCentral can be configured to create instant popups and other notifications upon detection of events like elevated skin temperatures, persons without required face masks, unauthorised access, and more.

Centralised management facilitates the pooling and coordination of resources and reduces repeated efforts for steady and efficient operations.
